

ANUPAM KUMAR

SALESFORCE FIELD SERVICE TECHNICAL ARCHITECT | ENTERPRISE FSM PLATFORM ARCHITECT | AI-ENABLED ENGINEERING LEADER

Kolkata, West Bengal, India | +91 95564 19286 | hire.anupamk@gmail.com | linkedin.com/in/anupam1407

EXECUTIVE PROFILE

Salesforce Field Service architect with 16+ years across Salesforce FSL, ServiceMax and enterprise field-service transformation. Progressed from hands-on engineering and lead development to practice architecture, global platform ownership and regional solution leadership. Designs end-to-end FSM solutions spanning Work Order and Service Appointment lifecycles, scheduling and optimization, dispatcher operations, mobile/offline execution, service documents, SAP/ERP/IoT integrations, migration and cutover, DevOps governance, production operations and AI-assisted engineering. Known for OOB-first judgment, explicit trade-off analysis and adapting architecture to the customer’s operating model rather than forcing a single pattern.

ARCHITECTURE DIFFERENTIATORS

End-to-End Salesforce Field Service	ESO, Bundling & Schedule Stability	Mobile / Offline & Governed Localization
SAP / ERP / IoT Integration	Metadata-Driven Platform Engineering	CI/CD, Observability & Operations
EMEA Localization & Rollout	Client Design & Presales	AI-Enabled SDLC with Human Gates

CURRENT EXPERIENCE — LTIMINDTREE / OTIS ELEVATORS

Associate Principal - Software Engineering (Enterprise Program Architect) Mar 2025 - Present

LTIMindtree | Client programme: Otis Elevators | Salesforce Field Service, EMEA Localization and Swiss Pilot

- Lead technical design and solution refinement for the EMEA Salesforce Field Service programme and Swiss pilot, translating localization, feature, organization-setup, interface, data-migration and field-technician requirements into scoped designs, assumptions, estimates and sprint-ready implementation work.
- Materially contributed to the Otis EMEA Localization SOW and delivery model covering end-to-end SFS architecture documentation, technical design, migration specification, cutover, release notes, SIT/regression/UAT, hypercare and AMS transition.
- Drive OOB-first architecture through client and Architecture Review Board discussions: reused scheduling policies and existing data-model elements, minimized new custom objects, selected validation-rule patterns where they avoided invasive Flow redesign, and retained regional configurability.
- Architected schedule stability for bundled work: keep the parent bundle visible and intact while moving completed Service Appointments out of the active bundle, so unfinished work retains context and completed appointments do not re-enter scheduling or optimization cycles.
- Guide ESO, dispatch, mobile/offline and multilingual architecture for EMEA, including governed localization of FSL Mobile Flow content using Translation Workbench as the translation source of truth; support Swiss technician/supervisor flows, service-report generation, country-configurable rules, interface inventory, deployment troubleshooting and alignment across business, architecture, integration, data and DevOps teams.
- Govern developer outputs, design and code reviews, Azure DevOps releases, QA/UAT readiness, defect solutioning and production transition. Apply GitHub Copilot and agentic workflows for analysis, refactoring, internationalization and documentation with human review, testing and release controls.

Recognition: LTIMindtree Salesforce Wall of Fame - recognised for rapid programme ramp-up, robust solutions for complex EMEA stories, clear presentation of alternatives and strong collaboration with Otis and LTIMindtree teams.

KONE — ENTERPRISE FIELD SERVICE PLATFORM OWNERSHIP

Owned and evolved a broad enterprise estate spanning Salesforce Field Service, a custom Salesforce application and the Supervisor Mobility Tool. Scope covered architecture, development governance, implementation, multi-country rollout, production operations, monitoring, backup oversight, integrations and long-term platform simplification.

Technology Design Expert - Field Service Management

Dec 2023 - Mar 2025

KONE Oyj | Pune, India | Enterprise FSM transformation and platform evolution

- Led architecture and technical delivery for transformation initiatives aligned with KONE's operating model; prioritized architecture and development backlog, reviewed developer designs and changes, coordinated external partners, and aligned Product Management, Product Owners, key users, AMS, integration and platform teams.
- Designed a KONE-specific schedule-stability pattern in which a parent Site Visit Work Order bound related Service Appointments, preserving visit-level cohesion and controlling schedule "ping-pong" while allowing scheduling and optimization to operate within business constraints.
- Championed simplification of the custom estate: moved from Asperii Bundler toward Salesforce Bundler, led ESO discovery through implementation, and enabled Salesforce-native mobile/offline capabilities to reduce dependency on custom mobility while protecting field-execution continuity.
- Owned Salesforce environment and CI/CD governance, including release preparation, deployment monitoring, release notes, CAB participation, environment refreshes, technical rollout support and production-readiness decisions; reported a 20% improvement in release-cycle efficiency.
- Established operational governance across AMS support, Salesforce ticket management, Splunk-based monitoring, technical-debt reviews and OwnBackup oversight; reported a 30% reduction in production issues through proactive monitoring and streamlined support.
- Owned Salesforce-SAP and IoT integration continuity for connected field operations, including impact analysis and coordination for the SAP ECC-to-HANA migration from the Field Service perspective, protecting interface contracts and business continuity.
- Tailored the common FSM platform for EMEA and other country contexts, balancing reusable global architecture with local process, rollout and compliance requirements without fragmenting the core platform.

Configuration Owner - Salesforce FSM

Sep 2021 - Dec 2023

KONE Oyj | Pune, India | End-to-end application lifecycle and rollout ownership

- Managed the end-to-end Salesforce Field Service development lifecycle across requirement refinement, architecture and technical backlog, implementation coordination, release, rollout and production support, working with global business and technology stakeholders.
- Implemented and enhanced Asperii Bundler, IoT-driven preventive maintenance for connected assets, customized Salesforce Schedule Optimization and custom dispatch processes designed around complex operational constraints and platform queue limitations.
- Directed platform roadmap preparation, OOB adoption and technical governance; introduced metadata-driven trigger patterns, unit-test framework improvements and Dynamic Apex Job Scheduler concepts to improve maintainability and scalable automation control.
- Supported multi-region rollout and production evolution of multiple FSM solutions, with reported automation and process improvements reducing manual intervention by 40%.

ARCHITECTURE PATTERN CONTRAST — SAME PROBLEM, DIFFERENT OPERATING MODELS

KONE — Visit Cohesion	OTIS — Bundle Continuity
Parent Site Visit Work Order binds related Service Appointments. The parent work context stabilizes the visit and preserves cohesion across related appointments.	Bundle remains intact and visible in Gantt. Completed Service Appointments move out one at a time; unfinished appointments remain in the bundle context.

Architectural principle: preserve each customer's work hierarchy and lifecycle semantics while preventing completed work from destabilizing active scheduling and optimization.

CAREER ARCHITECTURE PROGRESSION

Technical Architect - Salesforce / ServiceMax

Sep 2020 - Sep 2021

Mindtree Ltd. / Magnet 360 | Bhubaneswar, India

- Led Sales Cloud, Service Cloud and Experience Cloud implementation work for Harvard Business School, combining architecture governance, hands-on technical delivery and stakeholder alignment; the engagement reported 98% customer satisfaction.
- Expanded from hands-on development into Field Service business analysis for a Philips ServiceMax programme, translating service processes into platform requirements and strengthening the connection between business outcomes and technical implementation.
- Coordinated technical execution and stakeholder communication; projects were reportedly delivered 15% ahead of schedule.

Practice Architect - Digital Field Service Management

Feb 2018 - Sep 2020

Tata Consultancy Services (TCS) | Kochi, India

- Joined a strategic GE Healthcare Life Sciences transition as Lead Developer and Architect, then moved into practice architecture across Salesforce Field Service, ServiceMax and SAP field-service programmes for GE Healthcare, GE Aviation, GE Power, Vaillant, FieldCore, Ottobock and Zinier.
- Provided platform-agnostic architecture guidance across OOB Salesforce Field Service, ServiceMax and SAP FSM, selecting solution approaches based on service operating model, scheduling complexity, integration landscape and implementation constraints.
- Designed scheduling and optimization configurations for complex constraints, service objectives, dispatching models and field-execution priorities; also designed an independent plug-and-play contract-lifecycle component for Salesforce Field Service implementations.
- Designed and developed TCS FAST for Rapid Disaster Assessment, enabling more than 90,000 field assessments during the Kerala floods and demonstrating scalable field-operations architecture under urgent conditions.
- Helped scale the Digital Field Service Management practice from 5 to 200 members through architecture patterns, mentoring, training and cross-skilling; reported a 25% reduction in implementation time through reuse and process optimization.

Module Lead - Salesforce / ServiceMax

Aug 2014 - Jan 2018

Tech Mahindra Ltd. | Bhubaneswar, India | GE Healthcare Life Sciences

- Led hands-on design and development of the first ServiceMax pilot for GE Healthcare Life Sciences in the GE landscape, establishing a scalable field-service foundation and serving as lead developer for subsequent transformation work.
- Designed and implemented complex Salesforce/ServiceMax extensions for inventory management, parts ordering, debrief and self-service; adapted OOB mobile capabilities with SFM Flows to align technician execution with business processes across a 30,000+ technician ecosystem.
- Reported programme outcomes included a 50% reduction in call-centre abandon rate, 30% reduction in post-call work, 25% reduction in field-engineer travel time and 40% reduction in call-centre volume through self-service and process simplification.

Senior Systems Engineer - Salesforce

Mar 2010 - Aug 2014

Infosys Ltd. | Bhubaneswar, India

- Transitioned from mainframe technologies into the emerging Salesforce unit; built the hands-on Apex, configuration and client-delivery foundation for later Field Service architecture roles.
- Supported presales through POCs that contributed to the developing Salesforce Center of Excellence, and delivered Salesforce work for Syngenta, Lowe's and GE Healthcare Life Sciences.

CAREER ARC

Salesforce Engineer	Lead Developer	Client Technical Architect
FSM Practice Architect	Enterprise Platform Owner	Regional Field Service TA

SELECTED ARCHITECTURE & INNOVATION WORK

Internal assets and research are deliberately separated from client production delivery. Maturity labels below reflect the strongest evidence available.

ScaleGuard INTERNAL MVP / ACCELERATOR ASSET	Designed and built an internal Salesforce automation and observability MVP intended to make enterprise automation visible, configurable and supportable. The MVP included an administrative studio, orchestration, observability, mocked incident triage and integration stubs; it was positioned for stakeholder review, security validation and hardening, and further development as an accelerator asset. Architecture: Metadata-driven scheduling and dependency management; LWC Automation Studio; structured logging and correlation IDs; RBAC, FLS and permission sets; incident dashboards; Jira/ServiceNow integration.
Dynamic Apex Job Framework INTERNAL ARCHITECTURE / DESIGN ASSET	Designed a dispatcher-based orchestration framework to address the 100 Scheduled Apex job limit and high ESO job volumes while replacing static schedules with configurable execution control. Architecture: Configurable 1/3/6/12 dispatcher model; Custom Metadata for Batch, Queueable and ESO jobs; parameterized ESO wrapper; execution ordering, chaining, logging, retries, monitoring and admin LWC; 2GP managed-package direction.
LTM Document Builder Suite IMPLEMENTED INTERNAL ACCELERATOR ASSET	Architected and implemented a Salesforce-native, metadata-first and offline-oriented Field Service document platform to overcome template duplication, limited orchestration, complex object-graph aggregation and weak lifecycle governance in document solutions. Architecture: Canonical versioned JSON DTO; Apex assemblers and aggregation services; reusable LWC section library; CMDT-driven document types, rules, themes and localization; user-mode/FLS enforcement; audit events; CI/CD, migration and packaging strategy.
Internationalization Automation & FSL Mobile Localization INTERNAL CASE STUDY / ARCHITECTURE WORKFLOW	Designed a governed internationalization architecture spanning LWC, Apex, Flow and FSL Mobile Flow Text Template components while preserving Salesforce Translation Workbench as the single source of truth for translated content. Multi-agent workflows identified hardcoded UI text, classified strings, generated and mapped Custom Labels, and refactored metadata with human validation. Internal case-study material covered 44 LWC components and 789 labels. Architecture: Custom Labels and Translation Workbench as the authoritative translation layer; FSL Mobile Flow Text Template localization patterns; repository diagnostics and automated refactoring; human validation and regression gates; offline/mobile compatibility; runtime-performance and maintainability trade-offs; AWS Translate evaluation with encrypted storage and least-privilege access patterns.
OptiBridge RESEARCH / ACCELERATOR CONCEPT	Developed a research-backed architecture for supervised external optimization that extends native Salesforce Field Service for exceptionally large or constrained territories while retaining Salesforce as system of record, operational UI and final validator. Architecture: Territory/time-window ownership; constraint translation and parity; shadow-mode comparison; native ESO coexistence; Named/External Credentials; async orchestration; audit, rollback and reversible delta writeback; OR-Tools / NVIDIA cuOpt solver options.

ARCHITECTURE LEADERSHIP, PRESALES & CAPABILITY BUILDING

CLIENT & DESIGN LEADERSHIP Facilitate requirement clarification, solution refinement and trade-off discussions with business, product, architecture, integration, data, QA and DevOps stakeholders. Translate current-state constraints into maintainable target-state decisions and delivery artefacts.	TECHNICAL GOVERNANCE Review developer designs and code, define implementation guardrails, manage technical debt, align releases through CAB/ARB processes, and support production readiness, incident resolution and AMS transition.
PRESALES & SOLUTION SHAPING Contribute clarification questions, architecture assumptions, effort estimates, integration and AI-governance considerations, diagrams and solution artefacts for enterprise Salesforce pursuits. Client names intentionally omitted here.	AI-ENABLED ENGINEERING Drove AgEiS and GitHub Copilot practices across requirements, architecture, development, review, testing, release readiness, documentation and knowledge transfer with source control and human approval gates.
FSL ACADEMY & ENABLEMENT Created and facilitated architecture-led Salesforce Field Service learning covering object model, scheduling/optimization, mobile configuration, offline priming, synchronization, conflict resolution, evidence integrity, ERP integration and release governance.	PRACTICE & TALENT BUILDING Built reusable patterns, mentored engineers, facilitated training and technical interviews, and helped scale the TCS Digital Field Service Management practice from 5 to 200 members.

TECHNICAL ARCHITECTURE TOOLKIT

Salesforce Field Service, ServiceMax, Service Cloud, Sales Cloud, Experience Cloud, Apex, LWC, Flow, Salesforce DX, Custom Metadata, Custom Labels, Translation Workbench, FSL Mobile Flow localization, Text Template localization patterns, Service Document Builder, Enhanced Scheduling and Optimization, Bundler, Dispatcher Console, mobile/offline, preventive maintenance, work order and Service Appointment lifecycle.

Integration and platform engineering: SAP/ERP/IoT integration, MuleSoft, Dell Boomi, Kafka, REST/SOAP APIs, async Batch/Queueable patterns, metadata-driven frameworks, Salesforce-SAP/Snowflake interface awareness, CI/CD, Azure DevOps, Git, Splunk monitoring, OwnBackup, AMS and production governance.

CERTIFICATIONS & CREDENTIALS

Salesforce	AI Associate; AI Specialist; Tableau Desktop I Fundamentals.
ServiceMax	Certified Administrator; Advanced Administrator; SVMX 19.1, 19.2, 19.3 and 20.1; FSU/FSM credentials.
AWS	EKS, Compute, Serverless, Amazon Braket, File Storage and Solutions Architect knowledge/accreditations.
Databricks	Fundamentals; Generative AI; Manufacturing & Transportation specialization; Data Intelligence on SAP.
Additional	ServiceNow FSM micro-certification; leadership learning credentials.
